Chaos theory, in mechanics and mathematics, the study of apparently random or unpredictable behavior in systems governed by deterministic laws. Applications of the mathematics of chaos are highly diverse, including the study of turbulence, heart irregularities, plasma physics, and the motion of star clusters.

Chaos is a nonlinear deterministic process which "looks" random. There is a very good description of chaos and its origins in

the popular book by James Gleick (1987), entitled Chaos: Making a New Science. Also, Baumol and Benhabib (1989) gives a good survey of economic models which produce chaotic behavior. Chaos is interesting for several reasons.

A theory stating that seemingly unrelated events affect each other in a predictable, mathematical way. In investing, chaos theory is used to predict future stock prices using information that does not seem to affect prices directly, such as trading volume and trader sentiment. Computing these factors using chaos theory is as complex as it is controversial.

Chaos theory is the study of nonlinear dynamics, in which seemingly random events are actually predictable from simple deterministic equations. In a scientific context, the word chaos has a slightly different meaning than it does in its general usage as a state of confusion, lacking

any order.

Chaos Theory shows traders how they can predict price by analysing the chart itself and its price patterns, fractals, price repetition (trend, S&R), and wave patterns.

The main arguments are: (1) chaos theory is competitive and may well become a "convenient" theory of the financial market, (2) traditional finance does not take into account dynamics, while chaos theory is built on the dynamics of the system, which allows the theory to be brought closer to reality, and (3) Instability is associated not only with the crisis, to which the theory of chaos in the ...
