Innovations by Bosch in the field of diesel-injection technology have made a significant contribution to the diesel boom in Europe in the last few years. These systems make the diesel engine at once quieter, more economical, more powerful, and lower in emissions. This reference book provides a comprehensive insight into the extended diesel fuel-injection systems and into the electronic system used to control the diesel engine. This book also focuses on minimizing emissions inside of the engine and exhaust-gas treatment (e.g., by particulate filters). The texts are complemented by numerous detailed drawings and il-

lustrations. This 4th Edition includes new, updated and extended information on several subjects including: History of the diesel engine Common-rail system Minimizing emissions inside the engine Exhaust-gas treatment systems Electronic Diesel Control (EDC) Start-assist systems Diagnostics (On-Board Diagnosis) With these extensions and revisions, the 4th Edition of Diesel-Engine Management gives the reader a comprehensive insight into today's diesel fuel-injection technology.

There are approximately 4,000 fatalities in crashes involving trucks and buses in the United States each year. Though estimates are wide-ranging, possibly 10 to 20 percent of these crashes might

have involved fatigued drivers. The stresses associated with their particular jobs (irregular schedules, etc.) and the lifestyle that many truck and bus drivers lead, puts them at substantial risk for insufficient sleep and for developing short- and long-term health problems. Commercial Motor Vehicle Driver Fatigue, Long-Term Health and Highway Safety assesses the state of knowledge about the relationship of such factors as hours of driving, hours on duty, and periods of rest to the fatigue experienced by truck and bus drivers while driving and the implications for the safe operation of their vehicles. This report evaluates the relationship of these factors to drivers' health over the longer term, and identifies

improvements in data and research methods that can lead to better understanding in both areas.

Covert operations and ingenious weapons for irregular warfare were developed rapidly, and with great success, by the British during the Second World War, and the story of the most famous organizations involved like SOE, the SAS and Section D of SIS is now well known, but Military Intelligence (Research), the smallest but one of the most influential of these units is relatively unknown. Malcolm Atkin's intriguing and meticulously researched account describes their role at the heart of the War Office in trying to develop a 'respectable' arm of irregular warfare and their innovations ranging from the early Commandos, sticky bombs, limpet mines, booby traps, and even helicopters to the creation of the MI9 escape organization. They were an 'ideas factory' rather than an operational body but the book describes their worldwide operations including Finland, Norway, Romania, the Middle East and Central Africa. This is also a story of conflicting personalities between Jo Holland, the visionary but self-effacing head of MI(R) and his ambitious deputy,

Colin Gubbins (later head of SOE), and the latter's private war with SIS.

Over the past 80 years, histories of the Battle of Britain have consistently portrayed the feats of 'The Few' (as they were immortalized in Churchill's famous speech) as being responsible for the RAF's victory in the epic battle. However, this is only part

of the story. The results of an air campaign cannot be measured in terms of territory captured, cities occupied or armies defeated, routed or annihilated. Successful air campaigns are those that achieve their intended aims or stated objectives. Victory in the Battle of Britain was determined by whether the Luftwaffe achieved its objectives. The Luftwaffe, of course, did not, and this detailed and rigorous study explains why. Analysing the battle in its entirety in the context of what it was – history's first independent offensive counter-air campaign against the world's first integrated air defence system – Douglas C. Dildy and Paul F. Crickmore set out to re-examine this remarkable conflict. Presenting the events of the Battle of Britain in the context of the Luftwaffe's campaign and RAF Fighter Command's battles against it, this title is a new and innovative history of the battle that kept alive the Allies' chances of defeating Nazi Germany. Transnational organized crime interferes with the everyday lives of more and more people - and represents a serious threat to democracy. By now, organized crime has become an inherent feature of economic globalization, and the fine line between the legal and illegal operation of business networks is blurred. Additionally, few experts could claim to have comprehen-

sive knowledge and understanding of the laws and regulations governing the international flow of trade, and hence of the borderline towards criminal transactions. This book offers contributions from 12 countries around the world authored by 25 experts from a wide range of academic disciplines, representatives from civil society organizations and private industry, journalists, as well as activists. Recognizing the complexity of the issue, this publication provides a cross cultural and multi-disciplinary analysis of transnational organized crime including a historical approach from different regional and cultural contexts.

Chapman Pincher called Sonya the most successful agent-runner of all time, but this daring, courageous woman has remained an enigma, hunted and maligned by the spy-writers of the West. In this book, she tells her own story.

The automotive industry appears close to substantial change engendered by "self-driving" technologies. This technology offers the possibility of significant benefits to social welfare—saving lives; reducing crashes, congestion, fuel consumption, and pollution; increasing mobility for the disabled; and ultimately improving land use. This report is intended as a guide for state and federal policymakers on the many issues that this technology raises.

"Having been born a free man, and for more than thirty years enjoyed the blessings of liberty in a free State—and having at the end of that time been kidnapped and sold into Slavery, where I remained, until happily rescued in the month of January, 1853, after a bondage of twelve years—it has been suggested that an account of my life and fortunes would not be uninteresting to the public." - an excerpt

How to leave behind our unwieldy, gas-guzzling, carbon dioxide-emitting vehicles for cars that are green, smart, connected, and fun. This book provides a long-overdue vision for a new automobile era. The cars we drive today follow the same underlying design principles as the Model Ts of a hundred years ago and the tail-finned sedans of fifty years ago. In the twenty-first century, cars are still made for twentieth-century purposes. They are inefficient for providing personal mobility within cities—where most of the world's people now live. In this pathbreaking book, William Mitchell and two industry experts reimagine the automobile, describing vehicles of the near future that are green, smart, connected, and fun to drive. They roll out four big ideas that will make this both feasible and timely. The fundamental reinvention of the auto-

mobile won't be easy, but it is an urgent necessity—to make urban mobility more convenient and sustainable, to make cities more livable, and to help bring the automobile industry out of crisis.

The chapters in this volume were presented at the July–August 2008 NATO Advanced Study Institute on Unexploded Ordnance Detection and Mitigation. The conference was held at the beautiful Il Ciocco resort near Lucca, in the glorious Tuscany region of northern Italy. For the ninth time we gathered at this idyllic spot to explore and extend the reciprocity between mathematics and engineering. The dynamic interaction between world-renowned scientists from the usually disparate communities of pure mathematicians and applied scientists which occurred at our eight previous ASI's continued at this meeting. The detection and neutralization of unexploded ordnance (UXO) has been of major concern for very many decades; at least since the First World war. UXO continues to be the subject of intensive research in many fields of science, including mathematics, signal processing (mainly radar

and sonar) and chemistry. While today's headlines emphasize the mayhem resulting from the placement of improvised explosive devices (IEDs), humanitarian landmine clearing continues to draw significant global attention as well. In many countries of the world, landmines threaten the population and hinder reconstruction and fast, efficient utilization of large areas of the mined land in the aftermath of military conflicts. Fourth edition of the industry-renowned Railway Engineering Encyclopaedia. Expanded, enhanced, fully cross-referenced and illustrated throughout this is an indispensable book for minister, professional, trainee and enthusiast alike. This book aims at finding some answers to the questions: What is the influence of humans in controlling CAD and how much is human in control of its surroundings? How far does our reach as humans really go? Do the complex algorithms that we use for city planning nowadays live up to their expectations and do they offer enough quality? How much data do we have and can we control? Are today's inventions reversing the humanly controlled algorithms into a space where humans are

controlled by the algorithms? Are processing power, robots for the digital environment and construction in particular not only there to rediscover what we already knew and know or do they really bring us further into the fields of constructing and architecture? The chapter authors were invited speakers at the 6th Symposium "Design Modelling Symposium: Humanizing Digital Reality", which took place in Ensa-Ver-sailles, France from 16 - 20 September 2017.

the pressures of total war and what factors were important to it? This book rejects contentions that civilian morale fell a long way short of the favourable picture presented at the time and in hundreds of books and films ever since. While acknowledging that some negative attitudes and behaviour existed—panic and defeatism, ration-cheating and black-marketeering—it argues that these involved a very small minority of the population. In fact, most people behaved well, and this should be the real measure of civilian morale, rather than the failing of the few who behaved badly. The book shows that although before the war, the official prognosis was pessimistic, measures to bolster morale were taken nevertheless, in particular with regard to protection against air raids. An examination of indicative factors concludes that moral fluctuated but was in the main good, right to the end of the war. In examining this phenomenon, due credit is accorded to government policies for the maintenance of morale, but special emphasis is given to the 'invisible chain' of patriotic feeling that held the nation together during its time of

trial.

During 2004, oil prices reached levels unprecedented in recent years. Although world oil markets remain adequately supplied, high oil prices reflect increasingly uncertain conditions, and many countries are considering ways to improve capacity to handle market volatility and possible supply disruptions in the future. In light of these concerns, this

publication sets out a new quantitative assessment of the potential oil savings and costs of rapid oil demand restraint measures for transport, useful for both large-scale disruptions, and for smaller, localised supply disruptions in individual countries. It examines potential approaches for rapid uptake of measures such as telecommuting, ecodriving, and car-pooling; as well as

discussing methodologies for adapting policy measures to national circumstances.

This book explores how unconventional warfare tactics have opposed governments, from eighteenth-century guerrilla warfare to contemporary urban terrorism. The tactics of guerrilla leaders such as Lawrence, Mao, Guevara and Marighela are ex-

amined and the works of counter-insurgency theorists such as Galleni, Callwell, Thompson and Kitson are analysed.
